Installation of TA Framework

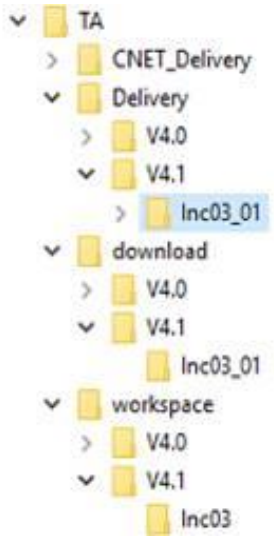

For the creation of test automation solutions, we provide a setup-based installation that puts everything in the right folder structure and creates a desktop icon for accessing the TA framework tools.
Different major versions\ deliveries of our TA framework can be installed on the same machine. So, if you're currently already using an older TA framework, you don't have to uninstall that one.

Installation steps:

(1) **Ensure having recommended file system folder structure.**

We highly recommend the following local folder structure on D: drive (please create the shown folder structure manually).

- **D:\TA -** acts as the common root folder.
- **D:\TA\download –** contains the installer files of each TA deliver.
- **D:\TA\delivery -** contains a folder for each installed TA framework delivery automatically created when respective setup.exe file is executed.
- **D:\TA\workspace** - acts as the root folder for all user created test solutions using the TA framework tools. The test user has the full responsibility for all the folders / files below TA\workspace.

(2) **Copy TA delivery into a correctly named subfolder under D:\TA\download**.
e.g., D:\TA\download\V4.1\Inc_09

(3) **Start setup.exe from the respective download sub folder.**
A new folder for the corresponding increment of PCS Neo V4.1 is created under D:\TA\delivery\V4.1.This folder has the TA framework tools and help documents for all the group modules available with the increment.

Update of TA solution to new delivery

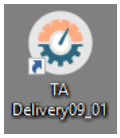

(1) E**nsure to have installed the latest Ranorex version 10.1.7**
If you have already installed an earlier version of Ranorex on your machine, then please execute the following steps first before installing Ranorex 10.1.7:
   a. Uninstall earlier Ranorex version.
   b. Uninstall Google Chrome.
   c. Re-install Google Chrome.
   d. Install latest Ranorex.

(2) **Install the latest TA framework** following the instructions of the previous section.

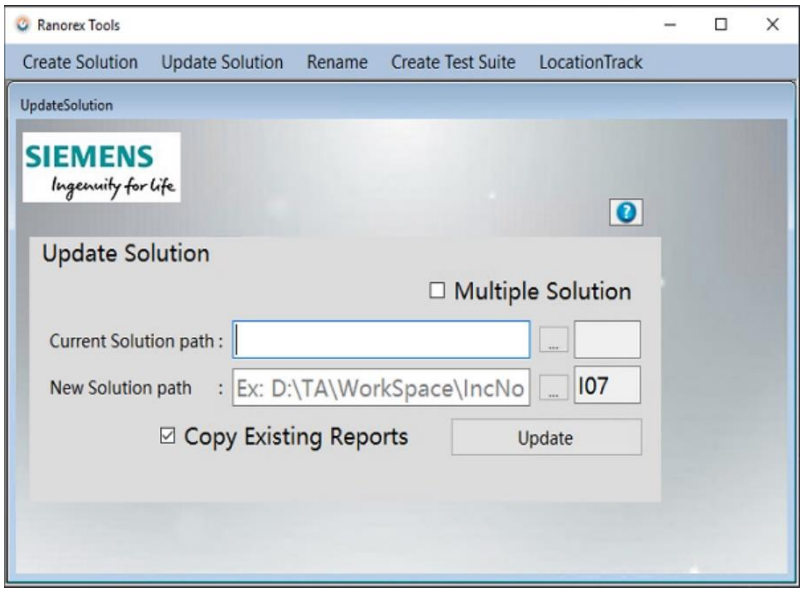

(3) **Make a backup of your old TA solutions.**

(4) If you have upgraded the installed Ranorex version:
   a. **Start Ranorex 10.1.7 and open your test solution**.
   b. If you are asked to **upgrade your solution files**, please select **Yes**.
   c. **Save your project** after successful upgrade and close Ranorex Studio.

(5) **Access the new TA framework** using the respective Desktop icon created after successful installation.

(6) **Use TA framework to update your solutions** to the latest framework delivery.
For more detailed Update solution steps, please check out the according help document found under the help icon.
While updating the existing solution please make sure that destination path doesn't already contain a folder/solution with the same name.

Important reminders

- Modules that shouldn't be used anymore or currently are prefixed with "DNU_" (DNU means **D**o **N**ot **U**se).
  The renaming of group modules affects all places inside your test cases where you used such a group module in the past. Hence, if a test fails after upgrading to the latest framework, please have a look whether there are group modules starting with DNU_ inside your test steps.
  If this is the case, have a look at the documentation or just ask the TA team to find out how to exchange the outdated module with a current new one.

- Modules that currently are not working due to PCSNeo product issues are prefixed with "CPI_" (Current Product Issue).
  In the case of these group modules, you must wait until the issue is fixed inside PCSNeo.

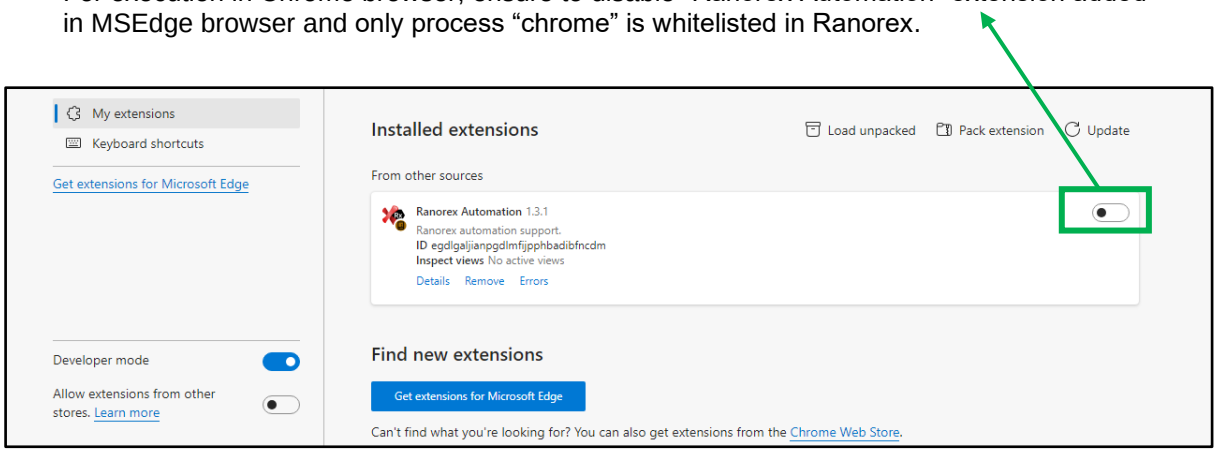

- To execute testcases in Microsoft Edge, follow below procedure:

  1. Ensure all browser instances (MS Edge, Chrome, IE) are closed.
  2. Navigate to MS Edge's extensions page (edge://extensions/ or find by MS Edge menu icon > Extensions) then ensure Developer Mode is enabled and add Chrome extension (C:\Program Files (x86)\Ranorex\Studio\Ranorex Chrome Extension).
  3. Ensure added extension is enabled.
  4. Remove following entries from Registry editor if extension is not adding:

     a. Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallForcelist
     b. Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallAllowList
     c. Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallWhitelist

  5. Restart MS Edge.
  6. Ensure only process "msedge" is whitelisted in Ranorex.
  7. Machine is ready to execute the test suite on MS Edge browser.

- For execution in Chrome browser, ensure to disable "Ranorex Automation" extension added in MSEdge browser and only process "chrome" is whitelisted in Ranorex.

Common issues and possible solutions

Issues	Possible Solutions
If image validation is getting failed.	• If other GMs (without image validation) are getting passed --> Contact a TA coordinator • If other GMs (without image validation) are getting failed --> Check for the resolution • The resolution should be 1920 * 1080 • Restart both the Laptop and the VM after changing the resolution
If all the GMs are getting failed.	• Check if the spy can track elements in product. If not, restart the VM. • Re-update the solution again. • Reformat the machine.
If excel data source bindings are unbound after upgrade of solution.	• Ensure excel is closed prior to upgrade
If Ranorex Studio report does not expand or does not show logged info.	• Add 'about:security_RanorexStudio.exe' to trusted sites found under InternetExplorer/Tools/Security
If TCs are failing due to delay issue.	• Sufficient delays should be added for the product to load completely, before proceeding to the next test case.
Unable to find POT and BOPs or SVG items available in CFC and display editor.	• Ensure that CFCEditor and display editor zoom value should be- set to 100%
If Online GMs are failing	• Need to set to screen size to 1:1 available in footer toolbar to work on alarm grid and faceplates using Ranorex
Unable to perform mouse scroll operation.	• Ensure to use GM to click on editor area before scroll operation.
If test cases are failing when both chrome and Microsoft edge are open.	• Ensure only one required browser is opened and enabled at a time and whitelisted the same (Ranorex → Whitelist → Edit Whitelist→ Select process (chrome/msedge)→ Add → Apply Whitelist)
